Responsive Cities

Charlie Carlett Bjarke Ingles

Twenty-first century cities are faced with environmental challenges and increasing demand to enhance user experiences in their urban landscape. This lecture series presents leaders in the fields of **architecture**, **design** and **computer science** who are in the forefront of new technologies and infrastructure.

Big U

When you look at the map of Manhattan, historically, since the 17th century, we've been creating more and more landfill. We made it, so we have to protect it. You need more than eight contiguous miles of flood protection. Can we make this flood protection without creating a wall that segregates the life of the city from the water around it? Learning from the High Line, can we imagine that the infrastructure for flooding could be combined with different programs?

We thought this project that we call the Big U—or the Dry Line—could be the love child of Jane Jacobs and Robert Moses. Our idea is that you have this big U [wrapping around the bottom half of Manhattan] that's compartmentalized just like a hull of a ship. You have narrow zones where you can protect one neighborhood at a time, and we got funding for the first compartment, on the Lower East Side. On the one hand, it has to resist the massive scale of an incoming flood, but it has to happen rooted in the demands and the dreams of the local community. We spent the last year working with people on the Lower East Side to provide input for what this could be like.

Donne à l'Éco

Link NYC

Kind of like a fitness tracker for an entire city, the “[Array of Things](#)” project was designed to measure and track the general health of Chicago. High-tech sensors affixed to lampposts throughout the city will continuously record things like weather, pollution, air quality, noise levels, temperature, carbon dioxide, and possibly even pedestrian traffic. The data will be accessible to the public, in hopes that developers will create apps that can organize the figures into helpful systems, such as programs that alert users to icy roads or neighborhoods with especially high pollen levels on a given day.

Link NYC

LinkNYC is part of our vision for a 21st Century Responsive City, where instrumentation of infrastructure, open data and APIs, and saturated connectivity can transform how a city and its citizens interact. The combination of gigabit Wi-Fi and an open technology platform will open the door to countless new opportunities, startups and investments in NYC.

Our design process is collaborative and iterative—working with the City, academic institutions, non-profits, community and industry leaders to create the best product and experience for New Yorkers. Link will be universally accessible regardless of technical, physical or financial abilities, providing all New Yorkers with access to all the social and economic opportunities that the Internet affords.
